## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Phase Change Materials Gel Pack competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Phase change material gel pack is a functional product that uses the thermophysical properties of phase change materials to achieve temperature control, the core of which consists of a polymer gel with a specific phase change temperature compounded with a phase change material (such as alkanes, hydrated salts or fatty acids, etc.). When absorbing or releasing heat, these gel packs will maintain a relatively stable temperature within a certain range through a phase change process (solid-liquid or liquid-solid transformation), rather than warming up or cooling down as rapidly as ordinary materials. The structure is usually encapsulated with polymer, which is both flexible and durable, and can be designed into different shapes and specifications according to the application scenarios. They are widely used in medical cold/hot packs, food preservation, temperature control of electronic devices, and thermal insulation of outdoor equipments, etc. They can achieve precise temperature management through the characteristics of phase-change energy storage, and they are the typical functional products integrating the material science and thermal management technology.

The global Phase Change Materials Gel Pack market size was estimated at USD 172.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
