Abstracts

Cryoablation refers to a method of freezing diseased tissue through low-temperature technology to achieve in situ inactivation of solid tissue. The working principle is to use low temperature to quickly cool down the diseased tissue to destroy cells, causing cell necrosis or apoptosis, thereby achieving the purpose of treatment. Since cryoablation uses the physical method of energy exchange to achieve the purpose of treatment, its trauma and side effects to the human body are much lower than conventional radiotherapy and chemotherapy, so it is hailed as a "green therapy". Traditional cryoablation equipment needs to be connected to high-pressure argon and helium cylinders when used, and the whole set of equipment becomes large and cumbersome. It is necessary to prepare a special warehouse to store a large number of gas cylinders. It is very inconvenient to use in hospitals where every inch of land is valuable, which affects its promotion and use. The new cryoablation adopts phase change heat transfer technology, selects liquid nitrogen and anhydrous ethanol vapor as phase change heat transfer media, can adopt a simple integrated design, and operate at low pressure. The working pressure of traditional cryoablation equipment is hundreds of atmospheres, and the working pressure of the new cryoablation is below 10 atmospheres, which is highly safe.

The global Phase Change Refrigeration Cryotherapy Ablation Device market size was estimated at USD 132.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 30.10% during the forecast period.
