Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Phase Controlled Thyristors (PCT) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A Phase Controlled Thyristor (PCT) is a high-power, semi-controlled semiconductor device made primarily of silicon, in which the conduction period and output voltage are regulated by adjusting the gate trigger angle. PCTs are widely used in high-voltage direct current (HVDC) transmission, industrial rectifiers, motor speed control, induction heating, and various power electronic converters. Featuring high voltage endurance, large current capacity, and superior reliability, the PCT serves as a core component in modern power conversion systems. The upstream supply chain mainly includes key raw materials such as monocrystalline silicon wafers, molybdenum plates, aluminum strips, tungsten wires, silicone gel, silver paste, ceramic substrates, and metal housings. Critical upstream suppliers include semiconductor wafer manufacturers (e.g., GlobalWafers, Simgui, Ferrotec), metal and packaging material providers (e.g., Boway Alloy, Advanced Technology & Materials, Hanergy), and auxiliary chemical and equipment suppliers (e.g., DuPont, 3M, NAURA, AMEC). In 2024, the global sales volume of Phase Controlled Thyristors (PCTs) reached 1,730,027 units, with an average unit price of USD 72.6 and an average gross profit margin of 32.5%. The annual production capacity of a single manufacturing line is 50,000 units. Regional Market Landscape
