Abstracts

A phase-locked loop control system is a control system that generates an output signal whose phase is related to the phase of an input signal. Its function is to synchronize the circuit output signal with its external reference signal. When the frequency or phase of the reference signal changes, the phase-locked loop will detect this change and adjust the output frequency through its internal feedback system until the two are synchronized again.

The global Phase-Locked Loop Control System market size was estimated at USD 2728.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
