Abstracts

A Phase Shifting Mask (PSM) is a photomask used in semiconductor lithography to enhance resolution by modulating the phase of light passing through certain regions of the mask, thereby improving contrast and enabling the patterning of smaller features than is possible with conventional binary masks; it achieves this by introducing controlled phase shifts between adjacent apertures, which counteract diffraction effects and sharpen the projected image on the wafer, making PSMs critical for advanced technology nodes in integrated circuit manufacturing.

The global Phase Shifting Mask (Psm) market size was estimated at USD 524.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
