Report Overview:

Phased array imaging microphones are imaging device used to locate sound sources and to characterize them. It consists of a group of microphones — also called microphone array — that are simultaneously acquired to form a representation of the location of the sound sources. With this method the sound signal is shown and also a sequence of acoustic images can be acquired as acoustic videos are generated at same time. Acoustic beamforming arrays enable the user to visualise different sound sources at different frequencies and source strengths. The resolution and ability to resolve sound sources spaced closely apart, and at lower frequencies, is mainly decided by overall size and number of microphones of the equipment being used.

The Global Phased Array Imaging Microphone Market Size was estimated at USD 199.00 million in 2023 and is projected to reach USD 300.33 million by 2029, exhibiting a CAGR of 7.10% during the forecast period.
