Abstracts

Phased array ultrasonic testing (PAUT) is an advanced non-destructive testing technology used to inspect and evaluate materials and structures for flaws or defects. It utilizes an array of ultrasonic transducers arranged in a specific pattern to emit and receive sound waves. By electronically controlling the timing and direction of the ultrasound waves, PAUT can scan a material from multiple angles and depths simultaneously. This allows for comprehensive and detailed inspection, providing high-resolution images of internal structures. PAUT is widely used in industries such as aerospace, manufacturing, and construction to detect defects like cracks, voids, or weld imperfections with precision and efficiency. Its capability to offer real-time, three-dimensional data makes it a valuable tool for ensuring the integrity and safety of critical components.

The global Phased Array Ultrasonic Testing Paut market size was estimated at USD 314.31 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
