Abstracts

Phenotypic drug discovery (PDD) refers to an approach in pharmaceutical research where compounds are screened for their effects on observable traits?such as cell morphology, proliferation, or functional outcomes?in whole cells, tissues, or model organisms, without requiring prior knowledge of a specific molecular target; this contrasts with target-based drug discovery, as it allows for the identification of novel mechanisms of action and the discovery of first-in-class therapeutics, particularly in complex diseases where pathophysiology is not fully understood or involves multiple pathways. The global phenotypic drug discovery market is experiencing robust growth, driven by increasing demand for novel therapeutics in areas like oncology, neuroscience, and rare diseases, where target-based approaches have historically faced challenges; technological advancements in high-content screening, automation, and data analytics are enhancing the efficiency and scalability of phenotypic assays, while rising investments from pharmaceutical companies and academic institutions further propel market expansion, though the complexity of data interpretation and higher costs compared to target-based methods remain notable constraints.

The global Phenotypic Drug Discovery market size was estimated at USD 587.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
