Abstracts

At present, in agricultural production, the basic means of pest control still mainly rely on chemical pesticides, but the long-term and uncontrolled use of chemical pesticides has brought many side effects. First, the emergence of pest resistance has led to the continuous increase in the amount and concentration of pesticides used, the cost has increased year by year, and prevention and control has become increasingly difficult; second, it destroys the ecological balance. While preventing and controlling pests, a large number of natural enemies are killed, causing secondary pests to rampantly harm; third, it pollutes the environment. A large amount of pesticides remain in crops, soil, rivers, lakes and seas, and are enriched in the human body through the food chain, causing further harm to humans. Relevant research departments at home and abroad are working hard to explore and study new ways and technologies for pest control. These studies include: the development of new, efficient, environmentally friendly, low-toxic, and low-residue chemical insecticides; the use of natural enemy insects and microbial pesticides; the application of insect sterilization technology and insect hormones; among them, the use of insect hormones, especially the use of insect pheromones for pest control is increasingly attracting people's attention and attention. Pest control pheromones, also known as insect sex pheromones or insect external hormones, are chemical factors secreted or excreted by insects, which are used to trigger social responses among members of the same species. These chemical pheromones transmit various information such as aggregation, foraging, mating, and vigilance among insects, and are the chemical molecular language of insect communication. With the continuous growth of global agricultural production and the increasing attention to environmental protection and ecological balance, the market size of pest control pheromones, as a green and efficient pest control method, has shown a steady growth trend. Pest control pheromones have important applications in agricultural production, mainly used to control crop diseases and insect pests. By using

the disorientation technology of agricultural pheromones, the mating behavior of pests can be interfered with, thereby reducing the population density of pests, reducing the use of pesticides, and ensuring the safety and quality of agricultural products. In addition, pest control pheromones can also be used in many fields such as plant quarantine and regional surveys of insects. The global pest control pheromone market presents a diversified competitive situation. Major manufacturers include Shin-Etsu, BASF, Sutterra, Biobest Group, Provivi and other well-known companies, which have occupied a certain share in the market with their respective technological advantages, product characteristics and market layout.
