## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Phillips Catalysts competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Phillips Catalysts reached approximately 44 kilotons, with an average global market price of around USD 62,000 per ton. A Phillips Catalyst is a chromium-based catalyst system, typically consisting of chromium oxide (CrO<sub>3</sub>) supported on high-surface-area silica, developed by the Phillips Petroleum Company in the 1950s for olefin polymerization. It is one of the most important heterogeneous catalysts in the petrochemical industry, especially for producing high-density polyethylene (HDPE) through the polymerization of ethylene. The catalyst operates via coordination polymerization, where chromium active sites on the silica surface initiate chain growth under moderate pressures and temperatures, without the need for external co-catalysts like aluminum alkyls. Its robustness, ability to yield polyethylene with desirable molecular weight distributions, and economic scalability have made the Phillips catalyst a cornerstone technology in global polyethylene production.

The global Phillips Catalysts market size was estimated at USD 2738.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
