Abstracts

Phosphate glasses are a specialized class of inorganic amorphous materials composed primarily of phosphorus pentoxide (P_2O_5) along with various modifying oxides, such as those of aluminum, zinc, calcium, or rare-earth elements, which imbue them with unique properties including high thermal expansion coefficients, low melting temperatures, excellent optical transparency from ultraviolet to mid-infrared wavelengths, and the ability to dissolve high concentrations of active ions like erbium or ytterbium. These materials are distinct from silicate or borate glasses due to their P_2O_5 network structure, which results in lower chemical durability but offers advantages in specific applications such as laser gain media, optical amplifiers, biomedical devices (e.g., bone regeneration scaffolds), solid-state electrolytes, and environmental sensors, where their tailored composition allows for precise control over physical, thermal, and optical characteristics.

The global Phosphate Glasses Material market size was estimated at USD 185.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
