Abstracts

Phosphodiesterase type 5 (PDE5) inhibitor is a class of medication that specifically targets and blocks the enzyme phosphodiesterase type 5. This enzyme is primarily found in the smooth muscle cells of the blood vessels, including those in the penis and lungs. By inhibiting PDE5, these medications promote the accumulation of cyclic guanosine monophosphate (cGMP), a chemical responsible for relaxing the smooth muscles and increasing blood flow in these areas. In the context of erectile dysfunction (ED), PDE5 inhibitors help improve blood flow to the penis, facilitating and maintaining erections. They are also used in the treatment of pulmonary arterial hypertension (PAH) to reduce blood vessel constriction and lower blood pressure in the lungs.

The global Phosphodiesterase Type 5 Pde5 Inhibitor market size was estimated at USD 2364.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.50% during the forecast period.
