Report Overview

Phosphoric acid doped polyphenylene is a kind of polymer material, which is prepared by doping Polyaniline and phosphoric acid. Polyaniline is an organic conductive polymer with good conductivity and controllable electrochemical properties. However, the conductivity of pure Polyaniline is relatively low. To improve its conductivity, external impurities such as phosphoric acid can be introduced through doping. As a strong acid, phosphoric acid can react with the amino group (NH₂) in Polyaniline to form the form of hydrochloride (H₃PO₄) or phosphate (H₃PO₄), thus introducing additional charge carriers and increasing the conductivity of Polyaniline. The conductivity of phosphoric acid doped polystyrene depends on the concentration of doped phosphoric acid and treatment conditions. By controlling the doping level, the conductivity of Polyaniline can be adjusted to make it suitable for different applications, such as batteries, supercapacitors, sensors, etc. Overall, phosphoric acid doped polystyrene is a polymer material with good conductivity, which can be applied in various electronic devices and energy storage fields.

The global Phosphoric Acid Doped Polyphenylene market size was estimated at USD 185.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
