Report Overview:

Electroless nickel-phosphorus plating, also referred to as E-nickel, is a chemical process that deposits an even layer of nickel-phosphorus alloy on the surface of a solid substrate, like metal or plastic. The process involves dipping the substrate in a water solution containing nickel salt and a phosphorus-containing reducing agent, usually a hypophosphite salt. It is the most common version of electroless nickel plating (EN plating) and is often referred by that name. A similar process uses a borohydride reducing agent, yielding a nickel-boron coating instead.

The Global Phosphorous Electroless Nickel Plating Market Size was estimated at USD 4936.37 million in 2023 and is projected to reach USD 7703.74 million by 2029, exhibiting a CAGR of 7.70% during the forecast period.
