## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Phosphosilicate Glass competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Phosphosilicate Glass (PSG) is a type of silicon dioxide ( $\text{SiO}_2$ ) doped with phosphorus pentoxide ( $\text{P}_2\text{O}_5$ ), commonly used in semiconductor manufacturing as a dielectric layer for insulation, planarization, and impurity gettering. Produced through processes like chemical vapor deposition (CVD), PSG exhibits a low dielectric constant and softens at elevated temperatures, enabling surface reflow and smoothing. Its phosphorus content helps trap mobile ions such as sodium, enhancing the reliability of integrated circuits. PSG is frequently employed in CMOS and MEMS fabrication, and its properties can be further tailored in variants like borophosphosilicate glass (BPSG) for improved film stress control and reflow behavior. Phosphosilicate Glass (PSG) is characterized by key parameters including phosphorus content (typically 1-10 wt%  $\text{P}_2\text{O}_5$ ), which influences its reflow temperature (850-1050°C), dielectric constant (around 3.5-4.5), and ion-gettering capability. Higher phosphorus levels enhance reflow and gettering efficiency but also increase moisture absorption, necessitating protective capping layers in some applications. PSG is typically deposited via LPCVD, PECVD, SACVD, or spin-on methods, with film thickness ranging from hundreds of nanometers to several microns. Its etch rate is higher than pure silicon dioxide, making it easier to pattern during semiconductor fabrication. These parameters collectively determine PSG's effectiveness in microelectronics, particularly in dielectric, passivation, and planarization roles.

The global Phosphosilicate Glass market size was estimated at USD 438.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30%

during the forecast period.
