Abstracts

Photoacoustic tomography (PAT) is a hybrid biomedical imaging modality that combines optical excitation with ultrasonic detection to generate high-resolution, high-contrast images of biological tissues by leveraging the photoacoustic effect, wherein pulsed laser light is absorbed by tissue chromophores, causing thermoelastic expansion and emitting ultrasonic waves that are then reconstructed into three-dimensional images, enabling non-invasive visualization of structural, functional, and molecular information such as hemoglobin concentration, oxygen saturation, lipid content, and melanoma biomarkers with deeper penetration than pure optical techniques while maintaining higher specificity than conventional ultrasound. The global PAT market is experiencing robust growth driven by increasing applications in preclinical research, oncology, neurology, and cardiovascular studies, as well as rising investments in biomedical imaging technologies, with key players focusing on enhancing imaging speed, resolution, and multimodal integration; however, high equipment costs, technical complexity, and regulatory hurdles remain significant barriers to widespread clinical adoption, though ongoing advancements in laser sources, detector arrays, and reconstruction algorithms are expected to further expand its utility in both diagnostic and therapeutic monitoring contexts.

The global Photoacoustic Tomography market size was estimated at USD 18.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
