Abstracts

Photocatalyst air purifiers represent an advanced category of air purification technology that utilizes a photocatalytic oxidation (PCO) process, typically involving a catalyst such as titanium dioxide (TiO₂) activated by ultraviolet (UV) light to break down airborne pollutants including volatile organic compounds (VOCs), bacteria, viruses, mold spores, and odors at a molecular level, transforming them into harmless substances like carbon dioxide and water vapor. Unlike traditional filter-based purifiers that trap particles, photocatalyst systems aim to destroy contaminants continuously without requiring frequent filter replacements, offering a maintenance-reduced and chemical-free approach to improving indoor air quality, particularly in environments where eliminating microorganisms and gaseous pollutants is a priority.

The global Photocatalyst Air Purifier market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Photocatalyst Air Purifier market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
