Abstracts

Photocatalyst ceramic boards represent a specialized category of building and decorative materials that integrate ceramic substrates with a photocatalytic coating?typically composed of titanium dioxide (TiO₂)?which, when activated by light, initiates oxidation-reduction reactions capable of breaking down organic pollutants, bacteria, viruses, and odors on the surface, effectively enabling self-cleaning, air-purifying, and antimicrobial properties. These products are engineered for both interior and exterior applications, including walls, facades, and tiling systems, and are valued in markets prioritizing hygiene, sustainability, and low-maintenance solutions. The technology leverages the principles of photocatalysis, where ultraviolet or visible light triggers the degradation of contaminants without consuming the coating itself, offering long-term functionality. Demand is driven by sectors such as healthcare, hospitality, public infrastructure, and residential construction, particularly in regions with high pollution levels or stringent cleanliness standards, while innovation focuses on enhancing photocatalytic efficiency under varied light conditions, improving coating durability, and expanding the range of compatible ceramic finishes and designs.

The global Photocatalyst Ceramic Boards market size was estimated at USD 385.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
