Abstracts

Photocatalyst textiles represent an advanced category of functional fabrics treated with photocatalyst materials, such as titanium dioxide (TiO₂), which utilize light energy—typically ultraviolet (UV) or visible light—to initiate oxidation-reduction reactions on the fabric surface. These reactions enable the textiles to break down organic pollutants, volatile organic compounds (VOCs), bacteria, viruses, and odors into harmless substances like carbon dioxide and water, thereby providing self-cleaning, air-purifying, and antimicrobial properties without the need for chemical detergents or disinfectants. This technology is increasingly integrated into a variety of textile applications, including medical and healthcare textiles (e.g., hospital linens, uniforms, wound dressings), indoor and outdoor furnishings (e.g., curtains, upholstery), automotive interiors, protective clothing, and everyday apparel, offering enhanced hygiene, sustainability, and maintenance benefits. The performance and durability of photocatalyst textiles depend on factors such as the method of catalyst application (e.g., coating, embedding), fabric composition, light exposure conditions, and the specific formulation of the photocatalytic agents used.

The global Photocatalyst Textiles market size was estimated at USD 160.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
