Abstracts

A photocathode DC electron gun is a specialized vacuum electron source that generates a continuous beam of electrons through the process of photoemission, where incident photons strike a photocathode material?typically semiconductors like gallium arsenide (GaAs) or alkali-antimonide compounds?causing the emission of electrons due to the photoelectric effect. This electron beam is then accelerated and shaped by a DC electric field applied between the photocathode and an anode, resulting in a stable, high-brightness, and low-emittance electron output. These devices are critical components in applications requiring precise electron beams, such as electron microscopes, particle accelerators, ultrafast electron diffraction experiments, and free-electron lasers, where their ability to produce coherent and tunable electron pulses with minimal energy spread offers significant advantages over thermionic or field-emission electron sources.

The global Photocathode Dc Electron Gun market size was estimated at USD 85.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
