Abstracts

Photochromic microcapsules are advanced microscopic structures that encapsulate photochromic compounds within a protective polymer or silica shell, designed to release their active ingredients in response to specific wavelengths of light, primarily ultraviolet (UV) radiation. These microcapsules enable precise control over color-changing properties, durability, and compatibility with various host materials, making them integral components in industries such as eyewear (e.g., transition lenses), textiles, coatings, cosmetics, and security printing. Their core function involves undergoing a reversible molecular transformation?switching from a transparent or lightly tinted state to a colored or darkened state upon UV exposure, and reverting to their original state once the UV stimulus is removed?thereby combining functionality with enhanced material performance and user adaptability.

The global Photochromic Microcapsule market size was estimated at USD 365.22 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.45% during the forecast period.
