## Abstracts

Photoion VOCs detector is a device used to detect and monitor the concentration of volatile organic compounds in the air. It uses photoionization technology to identify and measure the types and concentrations of VOCs. Photoionization technology is used to ionize VOCs molecules through a UV light source. When ultraviolet light is irradiated to the volatile organic compound molecules in the air, these molecules absorb energy and are ionized into positive ions and electrons. The generated positive ions are collected by the electric field and converted into electrical signals by the current sensor. The intensity of the current is proportional to the concentration of VOCs, so the concentration of VOCs in the air can be measured.

The global Photoion VOCs Detector market size was estimated at USD 233.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
