Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Photoionization (PID) Gas Detector competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Photoionization (PID) gas detectors utilize ultraviolet (UV) photoionization to detect volatile organic compound (VOC) concentrations. They are sensitive to gases at the ppb level and are widely used in chemical safety, environmental monitoring, and emergency response. In 2024, the global average price of photoionization (PID) gas detectors will be \$960 per unit, with annual sales of approximately 2 million units. Mainstream manufacturers have an annual production capacity of approximately 50,000 to 80,000 units per line, and the industry's gross profit margin ranges from 35% to 50%, with high-end products such as multi-gas detection and explosion-proof devices offering higher gross margins. The core of the upstream supply chain consists of UV lamps (from UK-based ION Science and Germany's Heraeus), sensor chips (ams OSRAM), signal processors (from Texas Instruments and Analog Devices), and aluminum alloy housings. Downstream direct customers include petrochemical companies (Sinopec and Shell), environmental protection agencies (EPA and local monitoring stations), and industrial safety system integrators (Honeywell and VIE). End users are used for hazardous gas leak warnings and air quality monitoring. Global Photoionization (PID) Gas Detector Market Trends: 1. Accelerating Integration of Intelligence and the Internet of Things New-generation PID detectors generally integrate Bluetooth, Wi-Fi, and 4G/5G modules, supporting real-time cloud data upload and remote monitoring. They also leverage AI algorithms to predict VOC concentration trends and locate leak sources, meeting the digital management needs of smart factories and smart environmental protection. 2. Miniaturization and Multi-Gas Detection Upgrades Portable devices are evolving towards smaller size (handheld) and

lower power consumption (with battery life exceeding 24 hours). Combined sensors (PID + electrochemical + MOS) are becoming mainstream, enabling simultaneous detection of VOCs, combustible gases, and specific toxic gases, improving adaptability to operating conditions.

3. Continuous Expansion of Emerging Application Scenarios

Beyond traditional chemical and petroleum industries, demand for PID detectors is rapidly growing in applications such as semiconductor manufacturing (photoresist volatiles monitoring), indoor air quality assessment (formaldehyde, TVOC), and rapid emergency response (drone-based systems), driving continued market expansion.

The global Photoionization (PID) Gas Detector market size was estimated at USD 1920.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
