Abstracts

Photomask glass substrate refers to a specialized high-purity, low-thermal-expansion glass material used as the base plate for photomasks in semiconductor manufacturing and display production. These substrates must exhibit exceptional flatness, surface quality, and dimensional stability, as they serve as the foundation for patterning intricate circuit designs via processes like photolithography. The glass is typically synthesized from fused silica or quartz due to their superior optical transparency, thermal resistance, and minimal thermal expansion, which are critical for maintaining precision under high-temperature processing conditions and ensuring accurate pattern transfer during exposure to ultraviolet light. Advanced coatings and treatments are often applied to enhance durability, chemical resistance, and adhesion of the photoresist layers, making the substrate an essential enabling component in the fabrication of integrated circuits, flat-panel displays, and other microelectronic devices.

The global Photomask Glass Substrate market size was estimated at USD 480.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
