### Report Overview

Photonic crystal fiber (PCF) is a kind of optical fiber that uses photonic crystals to form the cladding around the core of the cable. Photonic crystal is a low-loss periodic dielectric medium constructed using a periodic array of microscopic air holes that run along the entire fiber length. In PCFs, photonic crystals with photonic band gaps are constructed to prevent light propagation in certain directions with a certain range of wavelengths. Contrary to normal fiber optics, PCFs use total internal reflection or light confinement in hollow core methods to propagate light. Light propagation in PCFs is far superior to standard fiber, which uses constant lower refractive index cladding.

The global Photonic-crystal Fiber market size was estimated at USD 28 million in 2023 and is projected to reach USD 60.81 million by 2032, exhibiting a CAGR of 9.00% during the forecast period.

North America Photonic-crystal Fiber market size was estimated at USD 8.47 million in 2023, at a CAGR of 7.71% during the forecast period of 2024 through 2032.
