Report Overview

Photonic crystals are periodic dielectric structures that are designed to form the energy band structure for photons, which either allows or forbids the propagation of electromagnetic waves of certain frequency ranges, making them ideal for light-harvesting applications. Photonic crystals are attractive optical materials for controlling and manipulating light flow. One dimensional photonic crystals are already in widespread use, in the form of thin-film optics, with applications from low and high reflection coatings on lenses and mirrors to colour changing paints and inks. Two-dimensional photonic crystals are mainly commercialized with photonic crystal fibers. At present, two-dimensional photonic crystals are the most commonly used photonic crystal products, and the report data also mainly shows photonic crystal fibers.
