Abstracts

Silicon photonics (SiPh) is a platform for constructing photonic integrated circuits (PIC) for optical communication, high-speed data transfer, and photonic sensing devices. The semiconductor substrate material is a silicon-on-insulator (SOI) wafer. Standard semiconductor manufacturing processes are used to create components on a photonic layer from silicon (Si), which is transparent to infrared light. Silicon dioxide (SiO₂) or air is placed around the silicon to create a high refractive index difference, causing the light traveling in the components to travel through the circuit with very little loss. On-chip photonic integrated circuits are very compact, use less power, and operate at higher speeds (over 100 Gb/s) than traditional photonics devices, transferring information faster and more efficiently than electrical circuits. These advantages, combined with the ability to use standard complementary metal-oxide-semiconductor (CMOS) manufacturing techniques, drive the rapid increase of chips featuring silicon photonics.

The global Photonics Chip Design market size was estimated at USD 7946.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.60% during the forecast period.
