Abstracts

A photoplethysmogram (PPG) biosensor is a medical device that measures various physiological parameters by using light-based technology to detect blood volume changes in peripheral tissues, typically a person's fingertip. PPG sensors are commonly used to monitor heart rate, blood oxygen saturation (SpO2), and other vital signs. These sensors emit light into the skin and measure the amount of light absorbed or reflected by the blood flow. The data collected is valuable in healthcare, fitness monitoring, and wearable devices. The market for PPG biosensors has seen substantial growth due to increased demand for health and fitness monitoring technologies, with applications in both medical and consumer electronics sectors.

The global Photoplethysmogram Ppg Biosensor market size was estimated at USD 505.89 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.80% during the forecast period.
