Report Overview

Photopolymers are light-sensitive resins that change their physical or chemical properties when exposed to a light source, typically UV light. Unlike the thermoplastics used in Fused Deposition Modeling (FDM), photopolymers are thermosets, meaning that while the material strengthens as it is heated, once cured by a UV light, it cannot be remelted or reheated. With a range of colours and properties available, 3D printed resins are perfectly suitable for a range of applications, including visual and functional prototypes, medical devices and casting patterns for jewellery.
