Abstracts

A photoresist stripping system is a specialized semiconductor manufacturing equipment used to remove photoresist materials?light-sensitive polymers applied during photolithography?from silicon wafers or other substrates after they have served their purpose in patterning circuits. These systems employ various techniques, including wet chemical processing (using solvents or acid-based strippers), dry plasma ashing (utilizing reactive gases like oxygen to break down resist layers), or a combination of both, depending on the resist type, feature size, substrate sensitivity, and process requirements. The equipment must ensure high selectivity to avoid damaging underlying layers, provide uniform stripping across the wafer, and maintain strict control over contamination, temperature, and chemical composition to meet the precision and cleanliness standards essential in advanced semiconductor fabrication nodes.

The global Photoresist Stripping System market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
