Report Overview

The photosensitive transistor, as a sensitive part of the optical sensor, has been widely used in light detection, information reception, transmission, isolation, and other aspects, becoming an essential device for automatic control in various industries. The basic principle is that when light shines on the P-N junction, it absorbs light energy and converts it into electrical energy. When a reverse voltage is applied to a photosensitive transistor, the reverse current in the transistor changes with the change of light intensity. The greater the light intensity, the greater the reverse current, and most of them work in this state.
