Intraoral phosphor plate x-ray (also known as phosphor storage plate or PSP x-ray) eliminates the need for traditional film processing for dental radiography. Phosphor storage plates can convert existing film based imaging systems to a digital format that can be integrated into a computer or network system. As more and more medical and dental applications use digital radiography systems, the market for phosphor storage plate systems is expanding. PSP systems provide faster processing times, improved image quality, and electronic image storage and retrieval. Additionally, the elimination of hazardous waste generated by traditional film radiography systems and other environmental advantages of these systems are encouraging their adoption. Technological breakthroughs, including improvements in PSP sensitivity and resolution and the creation of new PSP materials and coatings, are also driving the market.

The global Photostimulable Phosphor (PSP) Systems market size was estimated at USD 81.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
