## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Photovoltaic Copper Paste competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Photovoltaic copper paste refers to the paste with copper as the main conductive phase in the manufacturing process of photovoltaic cells. It is used as a key material to replace silver paste in the photovoltaic industry to reduce costs and improve efficiency. The cost of copper is much lower than that of silver, so the use of copper paste can significantly reduce the manufacturing cost of photovoltaic cells. According to reports, the price of copper is only about 1/100 of the price of silver. The conductivity of copper is second only to silver, so when using copper paste, it is necessary to solve the problems of copper oxidation, diffusion and sintering to ensure that its conductivity meets the requirements. Under the general trend of "de-silvering" in the photovoltaic industry, copper paste is seen as a substitute for silver paste. Although copper paste has great potential.

The global Photovoltaic Copper Paste market size was estimated at USD 114.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 24.50% during the forecast period.
