Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Photovoltaic Grade High Purity Crystalline Silicon competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Polysilicon is a form of single-element silicon. When molten single-element silicon solidifies under supercooling conditions, silicon atoms are arranged in the form of diamond lattices to form many crystal nuclei. These crystal grains with different crystal plane orientations combine to form polysilicon. Polysilicon has a gray metallic luster and a density of 2.32~2.34g/cm³. The melting point is 1410?. The boiling point is 2355?. Polysilicon is the direct raw material for the production of single-crystal silicon and is the basic electronic information material for contemporary semiconductor devices such as artificial intelligence, automatic control, information processing, and photoelectric conversion. The main evaluation index of silicon is purity. According to the purity, it will be divided into metallurgical grade polysilicon (MG-Si), solar grade polysilicon (SG-Si) and electronic grade polysilicon (EG-Si). Solar-grade polysilicon (SOG-Si) has a purity between metallurgical-grade silicon and electronic-grade silicon, generally between 99.9999% and 99.9999999% (6N-9N), and is mainly used in the production of solar cells.

The global Photovoltaic Grade High Purity Crystalline Silicon market size was estimated at USD 12880.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.50% during the forecast period.
