Abstracts

Photovoltaic polysilicon, also known as solar-grade polysilicon, is a highly purified form of polycrystalline silicon that serves as the primary raw material for manufacturing crystalline silicon solar cells, which are the dominant technology in the global solar photovoltaic (PV) market. Produced through energy-intensive processes such as the Siemens process or fluidized bed reactor (FBR) technology, it undergoes further processing into ingots, wafers, and eventually solar cells that convert sunlight into electricity. Its purity?typically 99.9999% (6N) or higher?is critical to achieving high solar conversion efficiencies, and its production cost and supply availability directly influence the pricing and scalability of solar energy systems worldwide.

The global Photovoltaic Polysilicon market size was estimated at USD 18926.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
