Report Overview

Solar Cell is a device made from crystalline silicon or thin film that converts sunlight into electricity by a process known as the photovoltaic effect. There are two key indicators for solar cells: one is cell conversion efficiency, and the other is cell thickness.

Photovoltaics Modules use light energy from the sun to generate electricity through the photovoltaic effect. The majority of modules use wafer-based crystalline silicon cells or thin-film cells based on cadmium telluride or silicon. The structural (load carrying) member of a module can either be the top layer or the back layer. Cells must also be protected from mechanical damage and moisture. Most Photovoltaics Modules are rigid, but semi-flexible ones are available, based on thin-film cells.

In Japan, Photovoltaics Modules key players include Sharp, Trina Solar, Yingli, JA Solar, Canadian Solar, etc. The top five manufacturers hold a share over 40%.

In terms of product, Single Crystal Silicon is the largest segment, with a share over 45%. And in terms of application, the largest application is Ground Mount, followed by Residential, Commercial, etc.
