### Report Overview

Phthalic anhydride is a toxic, white solid crystalline compound in various forms or a clear molten liquid, with an irritating odor. It is slightly soluble in hot water, hydrolysing to phthalic acid. PA is soluble in alcohol and carbon disulphide. It reacts with strong oxidants and responds violently when heated with copper oxide or sodium nitrite, to cause an explosion hazard.

Phthalic anhydride is obtained from oxidation of o-xylene or naphthalene in presence of a catalyst usually a vanadium/titanium pentoxide. Plasticizers are the important application area for phthalic anhydride, followed by unsaturated polyester resins (UPR) and alkyd resins.

Plasticisers are the important application area for phthalic anhydride, about 51.04% of phthalic anhydride consumption is used for the production of plasticisers, followed by unsaturated polyester resins (UPR) and alkyd resins. The major end-use markets of phthalic anhydride include construction, automotive and marine industries.
