Abstracts

Physisorption analysis refers to a method used to characterize the surface area, pore size, and pore volume distribution of solid materials by measuring the physical adsorption and desorption of gas molecules (typically nitrogen at cryogenic temperatures) on the material's surface, driven by weak van der Waals forces without any chemical reaction. The global market for physisorption analysis is primarily driven by demand from research institutions, pharmaceutical companies, catalyst manufacturers, and materials science industries, where precise surface characterization is critical for product development and quality control. Key growth factors include advancements in nanotechnology, increased R&D investments in energy storage and catalysis, and stringent regulatory requirements in pharmaceuticals and environmental monitoring. Major players in the market offer automated, high-throughput instruments with enhanced accuracy and software integration, while regions like North America, Europe, and Asia-Pacific show significant adoption due to strong academic and industrial research ecosystems. However, high instrument costs and the need for specialized operator expertise remain constraints, particularly in emerging economies. The market is evolving with trends toward multi-gas analysis, miniaturization of devices, and integration with complementary techniques like chemisorption and mercury porosimetry.

The global Physisorption Analysis market size was estimated at USD 103.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
