Phytase when used as a feed enzyme is designed specifically to improve the availability of phosphorus from plant sources. Phytase is derived from a strain of *Pichia pastoris* through a proprietary cultivation and extraction technique. It can degrade phytic acid into inositol, or phosphoinositide and phosphoric acid. This product can eliminate the monogastric animal anti-nutrient action due to non-decomposition of phytic acid so as to improve the utility of nutrition. This enzyme also reduces the environmental pollution caused by the use of phosphorus.

The global Phytase Enzyme for Poultry market size was estimated at USD 185.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
