Abstracts

Phytogenics are bioactive components that function as defence mechanisms or signalling compounds within plants. Due to co-evolution, phytogenics can have physiological effects on animals by acting upon molecular receptors along the gastrointestinal tract.These receptors are present across species and are functionally important; when activated, they modulate animal immunity, physiology, metabolism and other functions. When used at the right dosage, phytogenics can be deployed as management tools to support the animal in combating many of the challenges faced in livestock production systems.Phytogenic feed additives (PFAs) are substances of plant origin added to animal diets to improve their performance, health, and well-being. Studies have shown that phytogenic combinations improve feed digestibility, increase enzyme production, and provide antioxidant effects, leading to better performance in poultry and other animals.

The global Phytogenic Feed Additives (PFAs) market size was estimated at USD 10720.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
