Abstracts

PID controller (proportional-integral-derivative controller) is a feedback control mechanism widely used in industrial control systems to accurately adjust the output of the system to match the desired set point. In SMPS (switching power supply), PID controller achieves precise control of output voltage or current by adjusting the on and off time of switching elements (such as MOSFET). In SMPS, PID controller is mainly used for voltage mode control and current mode control. PID controller keeps the output voltage or current at the set value by adjusting the duty cycle of the switching element, responds quickly to load changes or input voltage fluctuations, and reduces output voltage ripple and transient deviations.

The global PID Controller for SMPS market size was estimated at USD 292.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
