Abstracts

The Piezo Bone Surgery System represents a sophisticated medical device category that utilizes ultrasonic vibrations for precise, minimally invasive bone cutting and manipulation, primarily in dental, orthopedic, and maxillofacial surgery. These systems employ piezoelectric ceramics to generate high-frequency micro-oscillations, enabling selective cutting of mineralized tissues while sparing soft tissues, nerves, and vessels due to their tissue-selective nature. Characterized by enhanced precision, reduced intraoperative bleeding, and accelerated healing times compared to traditional rotary or oscillating saws, these systems are increasingly favored in procedures requiring high accuracy, such as dental implantology, sinus lifts, osteotomies, and trauma surgery. The technology's adoption is driven by advancements in piezoelectric efficiency, ergonomic handpiece design, and integration with surgical planning software, positioning it as a critical tool in modern operative settings where minimally invasive techniques and patient safety are prioritized.

The global Piezo Bone Surgery System market size was estimated at USD 550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
