Abstracts

A piezo chip actuator is a micro-scale electromechanical device that exploits the piezoelectric effect. The Piezo Chip Actuator consists of multiple ceramic layers and electrode layers stacked and intersected internally, with external electrodes printed on both sides to lead out the internal electrodes. Through precision grinding processes, the height tolerance of each piezoelectric ceramic is controlled to be smaller than $5\mu\text{m}$. When an electrical voltage is applied across its electrodes, the piezo chip undergoes precise and often tiny deformations, enabling it to generate forces and displacements. This actuator is widely used in applications demanding high precision at the micro or nano level, like in microelectronics, MEMS (Micro-Electro-Mechanical Systems), and biomedical devices due to its ability to provide accurate and controlled movements in a compact form factor.

The global Piezo Chip Actuator market size was estimated at USD 532.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
