Abstracts

Piezoelectric drive materials refer to materials that can change charge distribution and polarization strength under the action of an external electric field or mechanical stress. This material has unique physical properties, that is, it can generate charge under stress or deform under an electric field. Piezoelectric drive materials can realize the mutual conversion of electrical energy and mechanical energy. When an external force is applied, piezoelectric materials will produce charge separation, thereby generating voltage; conversely, when a voltage is applied, it will cause the size of the piezoelectric material to change and produce mechanical displacement.

The global Piezoelectric Drive Material market size was estimated at USD 153.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
