Report Overview:

Piezoelectricity is the electricity resulting in response to the applied mechanical stress. The electricity accumulates in solid material such as ceramics, crystals, and biological matter such as DNA, proteins, and bone. The piezoelectric effect is a reversible process in which material exhibiting direct piezoelectric effect i.e. charge separation due to stress also exhibits the converse piezoelectric effect i.e. the occurrence of stress and strain when the electric field is applied. Piezoelectric harvesting technology has the ability to integrate mechanical energy with the help of a piezoelectric element. The concerned method for energy harvesting includes piezoelectric generation, solar power generation, and thermoelectric generation among other generation techniques which use mechanical movement and electromagnetic phenomena.

The Global Piezoelectric Energy Harvesting Market Size was estimated at USD 90.12 million in 2023 and is projected to reach USD 122.86 million by 2029, exhibiting a CAGR of 5.30% during the forecast period.
