Abstracts

Piezoelectric gyroscope is a vibration gyroscope made using the positive piezoelectric effect and the reverse piezoelectric effect of piezoelectric materials. The core principle of the piezoelectric gyroscope lies in the pressure-electric properties of piezoelectric materials. Its core structure is a piece of piezoelectric material, which generates high-frequency vibrations through the application of high-frequency voltage. If there is external rotation at this time, the Coriolis force will be generated perpendicular to the vibration direction, causing the piezoelectric material to deform in that direction. This deformation further generates voltage, and by detecting the voltage, the magnitude of the angular velocity can be calculated.

The global Piezoelectric Gyroscope market size was estimated at USD 139.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
