### Report Overview:

Processing and manufacturing piezoelectric materials is challenging. In fact, stoichiometry (chemical reaction material control) and morphology (physical structure control) are critical parameters during piezoelectric material production, and accurate control of the piezoelectric crystallization process is required. In addition, commonly used piezoelectric material processes often include materials incompatible with standard CMOS technology. This has previously made it difficult to integrate piezoelectric elements into larger CMOS electronic circuits. The development of low cost, high quality deposition processes to produce piezoelectric materials has made significant progress during the last few decades. Chemical solution deposition and patterning of ferroelectric lead zirconate titanate (PZT) films, for example, has made it possible to integrate piezoelectric materials into MEMS-based transducers.

The Global Piezoelectric MEMS Foundry Service Market Size was estimated at USD 101.97 million in 2023 and is projected to reach USD 316.86 million by 2029, exhibiting a CAGR of 20.80% during the forecast period.
