Abstracts

Piezoelectric printheads refer to printheads made of special crystal materials that can sensitively respond to voltage. The key component of the piezoelectric inkjet printhead is the piezoelectric element. The current signal controls the deformation of the piezoelectric element, thereby ejecting the accumulated ink, which can more accurately control the size and ejection direction of the ink droplets, ensuring precise control of the ink. Micro-piezoelectric printheads are different from thermal foam printheads. Since the entire ink ejection process is completed at room temperature and does not require heating, in principle piezoelectric printheads are more durable than thermal foam printheads. In fact, the same is true above.

The global Piezoelectric Printhead market size was estimated at USD 366.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
