Abstracts

Piezoelectric vibration control device is a device that uses the inherent characteristics of piezoelectric materials (piezoelectric effect) to control and adjust vibration. It adjusts the vibration frequency, amplitude and phase by applying or removing an electric field. When an electric field is applied, the piezoelectric material will undergo mechanical deformation due to charge separation; conversely, when mechanical deformation is applied, charge separation will also occur. The device usually detects vibration signals through sensors, and then adjusts the frequency and intensity of the electric field through a controller to achieve precise vibration control. It is used in machinery manufacturing, vibration testing, and sensor technology. The unit price is about US\$1,000-5,000.

The global Piezoelectric Vibration Control Device market size was estimated at USD 432.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
