Report Overview

Piezoresponse force microscopy (PFM) is a variation of atomic force microscopy (AFM) that uses a conductive probe tip to measure the piezoelectric, and more commonly the ferroelectric, domains of a material. Unlike many other variations of AFM, PFM does not take any principles from other techniques. Instead, it applies the principles of the piezoelectric effect to obtain measurements, alongside the conventional AFM location techniques to determine which domains are being measured. This enables the simultaneous creation of a topographic map, alongside a ferroelectric domain map which has a high spatial resolution.

The global Piezoresponse Force Microscopy (Pfm) market size was estimated at USD 185.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
